

## ABSTRACT

The present invention provides a large database of electronic media related to locations that may be selected and formed into a virtual media booklet by users. The system automates the search, preparation, presentation, and delivery to users all requested information for a site, for eventual automated review of the delivered content. Designed as a presentation and distribution system of content, the system comes in a web based or stand-alone version. It allows authorized users to view the result of their search orders, organize, and create a virtual screen room for further filtering of content. The Digital Desktop Application also provides a virtual image processing center that enables authorized users the ability to provide a hard copy of any selected location information, if the so desired.
